General Books LLC. Paperback. Book Condition: New. This item is printed on demand. Paperback. 120 pages. Dimensions: 9.7in. x 7.4in. x 0.2in. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1884 Excerpt: . . . porate the solution by gentle heat, with stirring, until it is reduced to a small bulk, and solidifies on cooling; the residue should be entirely soluble in water. If it contains a white substance which will not dissolve, it is chloride of silver, derived from traces of silver in the metal; if there is a small amount of yellow or brown residue, some of the salt has been overheated; such residue should be redissolved in a little aqua regia, and evaporated to dryness again. One ounce of gold, if it is in small fragments, or thin sheet, will require about four ounces of aqua-regia to dissolve it. Chloride of gold is a yellow salt and dissolves in one and a half its weight of water. If it is properly made it contains one atomic weight (106.6 parts) of gold and three atomic weights (106.5 parts) of chlorine, and its composition is represented by the formulae  $\text{AuCl}_3$ . One troy ounce of gold will make 1 oz. 164 grains of the chloride. Oxide of gold is obtained by digesting a solution of the chloride with an excess of calcined magnesia, washing the precipitate first with dilute nitric acid, and then with water only; if caustic potash or soda be used instead of magnesia the oxide is liable to contain some of the alkali. The terbromide of gold may be formed by digesting oxide of gold in hydrobromic acid, and evaporating the solution by a gentle heat,...
